## Asymptotic analysis of piezoelectric energy harvester

Maoying Zhou

October 31, 2019

#### 1 Summary of the interested equations

Here we are interested in the classical model of a piezoelectric cantilever beam energy harvester, whose model is described using the following set of equations:

$$u'''' - \lambda^2 u = 0, (1)$$

and the accompanying boundary conditions:

$$\begin{cases} u(0) = 0 \\ u'(0) = 0 \end{cases}$$

$$u''(1) + \frac{j\lambda\beta\alpha^2}{j\lambda\beta + 1}u'(1) = 0$$

$$u'''(1) = 0$$
(2)

where  $\lambda$  is the eigenvalues for the problem, u denotes the displace function of the cantilever beam,  $\beta$  is the dimensionless externally connected resistance, and  $\alpha$  is the dimensionless piezoelectric coefficient. They can be expressed as follows

$$\lambda = \omega \sqrt{\frac{m_p l_p^4}{B_p}}, \quad \beta = R_l C_p \sqrt{\frac{B_p}{m_p l_p^4}}, \quad \alpha = e_p \sqrt{\frac{l_p}{C_p B_p}}, \tag{3}$$

where  $\omega$  is angular frequency,  $m_p$  is line mass density,  $l_p$  is the length of the cantilever beam,  $B_p$  is the bending stiffness,  $C_p$  is the inherent capacitance of the piezoelectric layer,  $e_p$  is the charge accumulation number,  $R_l$  is the externally connected resistance. In practical applications, dielectric property of piezoelectric materials indicate that the parameter  $\beta$  is changed from a very small value, which is close to a short-circuit condition to a very large value, which corresponds to an open-circuit condition. Thus we have that  $0 \le \beta \le \infty$ .

## 2 Asymptotic analysis when $\beta$ is small

Here we seek to find the behavior of the above system at a small value of connected resistance, i.e.,  $\beta \to 0$ . In this case, we set  $\beta$  to be the parameter for asymptotic expansion, and

$$\lambda^{(k)} = \lambda_0^{(k)} + \beta \lambda_1^{(k)} + \beta^2 \lambda_2^{(k)} + \cdots$$

$$u^{(k)} = u_0^{(k)} + \beta u_1^{(k)} + \beta^2 u_2^{(k)} + \cdots$$
(4)

where  $\lambda^{(k)}$  and  $u^{(k)}$  are the kth eigenvalue and eigenfunction respectively of the above mentioned system under perturbation.  $\lambda_0^{(k)}$  and  $u_0^{(k)}$  are the corresponding eigenvalue and eigenfunction of the unperturbed system at  $\beta=0$ :

$$u'''' - \lambda_0^2 u = 0, (5)$$

$$\begin{cases} u(0) = 0 \\ u'(0) = 0 \\ u''(1) = 0 \\ u'''(1) = 0 \end{cases}$$
 (6)

Obviously, the unperturbed system is a classical eigenvalue problem with the eigenvalues determined by

$$1 + \cosh(\sqrt{\lambda_0})\cos(\sqrt{\lambda_0}) = 0 \tag{7}$$

whose first several values are

$$\frac{\sqrt{\lambda_0^{(1)}}}{\pi} = 0.59686, \quad \frac{\sqrt{\lambda_0^{(2)}}}{\pi} = 1.49418, \quad \frac{\sqrt{\lambda_0^{(3)}}}{\pi} = 2.50025, \quad \frac{\sqrt{\lambda_0^{(4)}}}{\pi} = 3.49999, \quad \cdots$$
 (8)

Take the asymptotic expansions and substitute them into the previously derived system of equations, we have the following asymptotic expansions to different orders of  $\beta$ :  $O(\beta^0)$ :

$$\begin{cases}
 u_0'''' - \lambda_0^2 u_0 = 0 \\
 u_0(0) = 0 \\
 u_0'(0) = 0 \\
 u_0''(1) = 0 \\
 u_0'''(1) = 0
\end{cases} \tag{9}$$

 $O(\beta^1)$ :

$$\begin{cases}
 u_1'''' - \left(\lambda_0^2 u_1 + 2\lambda_0 u_0 \lambda_1\right) = 0 \\
 u_1(0) = 0 \\
 u_1'(0) = 0 \\
 u_1''(1) + j\alpha^2 \lambda_0 u_0'(1) = 0 \\
 u_1'''(1) = 0
\end{cases} \tag{10}$$

 $O(\beta^2)$ :

$$\begin{cases}
 u_2'''' - \left(\lambda_0^2 u_2 + 2\lambda_0 u_1 \lambda_1 + \lambda_1^2 u_0 + 2\lambda_0 u_0 \lambda_2\right) = 0 \\
 u_2(0) = 0 \\
 u_2'(0) = 0 \\
 u_2''(1) + \alpha^2 \lambda_0 u_0'(1) + j\alpha^2 \left[\lambda_0 u_1'(1) + \lambda_1 u_0'(1)\right] = 0 \\
 u_2'''(1) = 0
\end{cases} \tag{11}$$

## 3 Asymptotic analysis when $\beta$ is large

Here we seek to find the behavior of the above system at a large value of connected resistance, i.e.,  $\beta \to \infty$ . In this case, we set  $\frac{1}{\beta}$  to be the parameter for asymptotic expansion and

$$\lambda^{(k)} = \tilde{\lambda}_0^{(k)} + \left(\frac{1}{\beta}\right) \tilde{\lambda}_1^{(k)} + \left(\frac{1}{\beta}\right)^2 \tilde{\lambda}_2^{(k)} + \cdots$$

$$u^{(k)} = \tilde{u}_0^{(k)} + \left(\frac{1}{\beta}\right) \tilde{u}_1^{(k)} + \left(\frac{1}{\beta}\right)^2 \tilde{u}_2^{(k)} + \cdots$$
(12)

where  $\tilde{\lambda}^{(k)}$  and  $\tilde{u}^{(k)}$  are the kth eigenvalue and eigenfunction respectively of the above mentioned system under perturbation.  $\tilde{\lambda}_0^{(k)}$  and  $\tilde{u}_0^{(k)}$  are the corresponding eigenvalue and eigenfunction of the unperturbed system at  $\beta = \infty$ :  $O(\frac{1}{30})$ :

$$\begin{cases}
\tilde{u}_0'''' - \lambda_0^2 \tilde{u}_0 = 0 \\
\tilde{u}_0(0) = 0 \\
\tilde{u}_0'(0) = 0 \\
\tilde{u}_0''(1) + \alpha^2 \tilde{u}_0'(1) = 0 \\
\tilde{u}_0'''(1) = 0
\end{cases} \tag{13}$$

$$O(\frac{1}{\beta^1})$$
:

$$\begin{cases}
\tilde{u}_{1}^{""} - \left(\tilde{\lambda}_{0}^{2}u_{1} + 2\tilde{\lambda}_{0}\tilde{u}_{0}\tilde{\lambda}_{1}\right) = 0 \\
\tilde{u}_{1}(0) = 0 \\
\tilde{u}_{1}^{"}(0) = 0 \\
\tilde{u}_{1}^{"}(1) + \alpha^{2}\tilde{u}_{1}^{"}(1) + \frac{j\alpha^{2}}{\tilde{\lambda}_{0}}\tilde{u}_{0}^{"}(1) = 0 \\
\tilde{u}_{1}^{"}(1) = 0
\end{cases} \tag{14}$$

 $O(\frac{1}{\beta^2})$ :

$$\begin{cases}
\tilde{u}_{2}^{""} - \left(\tilde{\lambda}_{0}^{2}\tilde{u}_{2} + 2\tilde{\lambda}_{0}\tilde{u}_{1}\tilde{\lambda}_{1} + \tilde{\lambda}_{1}^{2}\tilde{u}_{0} + 2\tilde{\lambda}_{0}\tilde{u}_{0}\tilde{\lambda}_{2}\right) = 0 \\
\tilde{u}_{2}(0) = 0 \\
\tilde{u}_{2}^{\prime}(0) = 0
\end{cases}$$

$$\tilde{u}_{2}^{\prime}(1) + \left[\alpha^{2}\tilde{u}_{2}^{\prime}(1) - \frac{\alpha^{2}}{\tilde{\lambda}_{0}^{2}}\tilde{u}_{0}^{\prime}(1)\right] + j\left[\frac{\alpha^{2}}{\tilde{\lambda}_{0}}\tilde{u}_{1}^{\prime}(1) - \frac{\alpha^{2}\tilde{\lambda}_{1}}{\tilde{\lambda}_{0}^{2}}\tilde{u}_{0}^{\prime}(1)\right] = 0$$

$$\tilde{u}_{2}^{"}(1) = 0$$

$$\tilde{u}_{2}^{"}(1) = 0$$

# 4 Asymptotic analysis in terms of small $\alpha^2$

Directly using the eigenvalue analysis method for linear boundary value problem, we arrive at the equation for the eigenvalue  $\lambda$ :

$$\sqrt{\lambda} \left[ 1 + \left( \frac{e^{\sqrt{\lambda}} + e^{-\sqrt{\lambda}}}{2} \right) \cos \sqrt{\lambda} \right] + \frac{j\beta\lambda\alpha^2}{1 + j\beta\lambda} \left[ \left( \frac{e^{\sqrt{\lambda}} - e^{-\sqrt{\lambda}}}{2} \right) \cos \sqrt{\lambda} + \left( \frac{e^{\sqrt{\lambda}} + e^{-\sqrt{\lambda}}}{2} \right) \sin \sqrt{\lambda} \right] = 0$$
(16)

or

$$\sqrt{\lambda} \left[ 1 + \cosh\sqrt{\lambda}\cos\sqrt{\lambda} \right] + \frac{j\beta\lambda\alpha^2}{1 + j\beta\lambda} \left[ \sinh\sqrt{\lambda}\cos\sqrt{\lambda} + \cosh\sqrt{\lambda}\sin\sqrt{\lambda} \right] = 0 \tag{17}$$

Taking the parameter  $\alpha^2$  as the small parameter  $\epsilon$  and expanding the eigenvalue  $\lambda$  in terms of this  $\epsilon$ , we have

$$\lambda = \lambda_0 + \epsilon \lambda_1 + \epsilon^2 \lambda_2 + \cdots \tag{18}$$

and therefore:

 $O(\epsilon^0)$ :

$$1 + \cosh\sqrt{\lambda_0}\cos\sqrt{\lambda_0} = 0 \tag{19}$$

 $O(\epsilon^1)$ :

$$2j\beta\lambda_0\left(\cosh\sqrt{\lambda_0}\sin\sqrt{\lambda_0}+\sinh\sqrt{\lambda_0}\cos\sqrt{\lambda_0}\right)+(1+j\beta\lambda_0)\lambda_1\left(-\cosh\sqrt{\lambda_0}\sin\sqrt{\lambda_0}+\sinh\sqrt{\lambda_0}\cos\sqrt{\lambda_0}\right)=0$$
(20)

or equivalently

$$\lambda_1 = \frac{2j\beta\lambda_0}{(1+j\beta\lambda_0)} \frac{\left(\cosh\sqrt{\lambda_0}\sin\sqrt{\lambda_0} + \sinh\sqrt{\lambda_0}\cos\sqrt{\lambda_0}\right)}{\left(\cosh\sqrt{\lambda_0}\sin\sqrt{\lambda_0} - \sinh\sqrt{\lambda_0}\cos\sqrt{\lambda_0}\right)} \tag{21}$$

#### 5 Asymptotic analysis in terms of small $\alpha^2$

The forced vibration problem of a piezoelectric cantilever bimorph is described by

$$u'''' - \lambda^2 u = \lambda^2, \tag{22}$$

and the accompanying boundary conditions:

$$\begin{cases} u(0) = 0, \\ u'(0) = 0, \\ u''(1) + \frac{j\lambda\beta}{j\lambda\beta + 1} \epsilon u'(1) = 0, \\ u'''(1) = 0. \end{cases}$$
 (23)

This problem can readily be solved using a conventional boundary value problem solver. Howevere, here we would like to develop an asymptotic expansion of the solution for the system. Using  $\epsilon$  as a parameter, we have

$$u(x;\epsilon) = A_{\epsilon}\cos\sqrt{\lambda}x + B_{\epsilon}\sin\sqrt{\lambda}x + C_{\epsilon}\cosh\sqrt{\lambda}x + D_{\epsilon}\sinh\sqrt{\lambda}x - 1$$
 (24)

As a result, we have

$$u'(x;\epsilon) = \sqrt{\lambda} \left( -A_{\epsilon} \sin \sqrt{\lambda} x + B_{\epsilon} \cos \sqrt{\lambda} x + C_{\epsilon} \sinh \sqrt{\lambda} x + D_{\epsilon} \cosh \sqrt{\lambda} x \right)$$

$$u''(x;\epsilon) = \lambda \left( -A_{\epsilon} \cos \sqrt{\lambda} x - B_{\epsilon} \sin \sqrt{\lambda} x + C_{\epsilon} \cosh \sqrt{\lambda} x + D_{\epsilon} \sinh \sqrt{\lambda} x \right)$$

$$u'''(x;\epsilon) = \lambda \sqrt{\lambda} \left( A_{\epsilon} \sin \sqrt{\lambda} x - B_{\epsilon} \cos \sqrt{\lambda} x + C_{\epsilon} \sinh \sqrt{\lambda} x + D_{\epsilon} \cosh \sqrt{\lambda} x \right)$$

$$(25)$$

Thus the above boundary value problem is converted into the following linear equation systems:

$$\begin{cases}
A_{\epsilon} + C_{\epsilon} = 1, \\
B_{\epsilon} + D_{\epsilon} = 0, \\
\left( -A_{\epsilon} \cos \sqrt{\lambda} - B_{\epsilon} \sin \sqrt{\lambda} + C_{\epsilon} \cosh \sqrt{\lambda} + D_{\epsilon} \sinh \sqrt{\lambda} \right) + \\
\frac{j\beta\sqrt{\lambda}}{j\lambda\beta + 1} \epsilon \left( -A_{\epsilon} \sin \sqrt{\lambda} + B_{\epsilon} \cos \sqrt{\lambda}x + C_{\epsilon} \sinh \sqrt{\lambda}x + D_{\epsilon} \cosh \sqrt{\lambda}x \right) = 0, \\
A_{\epsilon} \sin \sqrt{\lambda} - B_{\epsilon} \cos \sqrt{\lambda} + C_{\epsilon} \sinh \sqrt{\lambda} + D_{\epsilon} \cosh \sqrt{\lambda} = 0.
\end{cases}$$
(26)

Using the following regular expansion:

$$\begin{cases}
A_{\epsilon} = A_0 + \epsilon A_1 + \epsilon^2 A_2 + \cdots, \\
B_{\epsilon} = B_0 + \epsilon B_1 + \epsilon^2 B_2 + \cdots, \\
C_{\epsilon} = C_0 + \epsilon C_1 + \epsilon^2 C_2 + \cdots, \\
D_{\epsilon} = D_0 + \epsilon D_1 + \epsilon^2 D_2 + \cdots,
\end{cases}$$
(27)

we obtain the successive expansion problem:  $O(\epsilon^0)$ :

$$\begin{cases}
A_0 + C_0 = 1, \\
B_0 + D_0 = 0, \\
-A_0 \cos \sqrt{\lambda} - B_0 \sin \sqrt{\lambda} + C_0 \cosh \sqrt{\lambda} + D_0 \sinh \sqrt{\lambda} = 0, \\
A_0 \sin \sqrt{\lambda} - B_0 \cos \sqrt{\lambda} + C_0 \sinh \sqrt{\lambda} + D_0 \cosh \sqrt{\lambda} = 0.
\end{cases} (28)$$

The solution is

$$\begin{cases}
A_0 = \frac{1 + \cos\sqrt{\lambda}\cosh\sqrt{\lambda} - \sin\sqrt{\lambda}\sinh\sqrt{\lambda}}{2 + 2\cos\sqrt{\lambda}\cosh\sqrt{\lambda}} \\
B_0 = \frac{\cosh\sqrt{\lambda}\sin\sqrt{\lambda} + \cos\sqrt{\lambda}\sinh\sqrt{\lambda}}{2 + 2\cos\sqrt{\lambda}\cosh\sqrt{\lambda}} \\
C_0 = \frac{1 + \cos\sqrt{\lambda}\cosh\sqrt{\lambda} + \sin\sqrt{\lambda}\sinh\sqrt{\lambda}}{2 + 2\cos\sqrt{\lambda}\cosh\sqrt{\lambda}} \\
D_0 = -\frac{\cosh\sqrt{\lambda}\sin\sqrt{\lambda} + \cos\sqrt{\lambda}\sinh\sqrt{\lambda}}{2 + 2\cos\sqrt{\lambda}\cosh\sqrt{\lambda}}
\end{cases} (29)$$

Hence we have

$$-A_0 \sin \sqrt{\lambda} + B_0 \cos \sqrt{\lambda} + C_0 \sinh \sqrt{\lambda} + D_0 \cosh \sqrt{\lambda} = \frac{\sinh \sqrt{\lambda} - \sin \sqrt{\lambda}}{\cos \sqrt{\lambda} \cosh \sqrt{\lambda} + 1}$$
(30)

 $O(\epsilon^1)$ :

$$\begin{cases}
A_1 + C_1 = 0, \\
B_1 + D_1 = 0, \\
\left( -A_1 \cos \sqrt{\lambda} - B_1 \sin \sqrt{\lambda} + C_1 \cosh \sqrt{\lambda} + D_1 \sinh \sqrt{\lambda} \right) + \\
\frac{j\beta\sqrt{\lambda}}{j\lambda\beta + 1} \left( -A_0 \sin \sqrt{\lambda} + B_0 \cos \sqrt{\lambda} + C_0 \sinh \sqrt{\lambda} + D_0 \cosh \sqrt{\lambda} \right) = 0, \\
A_1 \sin \sqrt{\lambda} - B_1 \cos \sqrt{\lambda} + C_1 \sinh \sqrt{\lambda} + D_1 \cosh \sqrt{\lambda} = 0.
\end{cases}$$
(31)

The solution is

$$\begin{cases}
A_{1} = \frac{j\beta\sqrt{\lambda}}{1+j\beta\lambda} \left( -\frac{\sinh\sqrt{\lambda} - \sin\sqrt{\lambda}}{\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 1} \right) \left( -\frac{\cos\sqrt{\lambda} + \cosh\sqrt{\lambda}}{2\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 2} \right) \\
B_{1} = \frac{j\beta\sqrt{\lambda}}{1+j\beta\lambda} \left( -\frac{\sinh\sqrt{\lambda} - \sin\sqrt{\lambda}}{\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 1} \right) \left( \frac{\sinh\sqrt{\lambda} - \sin\sqrt{\lambda}}{2\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 2} \right) \\
C_{1} = \frac{j\beta\sqrt{\lambda}}{1+j\beta\lambda} \left( -\frac{\sinh\sqrt{\lambda} - \sin\sqrt{\lambda}}{\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 1} \right) \left( \frac{\cos\sqrt{\lambda} + \cosh\sqrt{\lambda}}{2\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 2} \right) \\
D_{1} = \frac{j\beta\sqrt{\lambda}}{1+j\beta\lambda} \left( -\frac{\sinh\sqrt{\lambda} - \sin\sqrt{\lambda}}{\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 1} \right) \left( \frac{\sin\sqrt{\lambda} - \sinh\sqrt{\lambda}}{2\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 2} \right)
\end{cases} (32)$$

Then we have

$$-A_1 \sin \sqrt{\lambda} + B_1 \cos \sqrt{\lambda} + C_1 \sinh \sqrt{\lambda} + D_1 \cosh \sqrt{\lambda}$$

$$= \frac{j\beta\sqrt{\lambda}}{1+j\beta\lambda} \left( -\frac{\sinh \sqrt{\lambda} - \sin \sqrt{\lambda}}{\cos \sqrt{\lambda} \cosh \sqrt{\lambda} + 1} \right) \left( \frac{\cos \sqrt{\lambda} \sinh \sqrt{\lambda} + \sin \sqrt{\lambda} \cosh \sqrt{\lambda}}{\cos \sqrt{\lambda} \cosh \sqrt{\lambda} + 1} \right)$$
(33)

$$\left\{ -\frac{\cos\sqrt{\lambda} + \cosh\sqrt{\lambda}}{2\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 2}, \frac{\sinh\sqrt{\lambda} - \sin\sqrt{\lambda}}{2\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 2}, \frac{\cos\sqrt{\lambda} + \cosh\sqrt{\lambda}}{2\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 2}, \frac{\sin\sqrt{\lambda} - \sinh\sqrt{\lambda}}{2\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 2} \right\} \\
\frac{i\beta\sqrt{\lambda}}{1 + i\beta\lambda} \left( -\frac{\sinh\sqrt{\lambda} - \sin\sqrt{\lambda}}{\cos\sqrt{\lambda}\cosh\sqrt{\lambda} + 1} \right) \\
(34)$$
